Appendix E – Laboratory reports

# **1. Introduction**

Fire and Rescue NSW (FRNSW) engaged GHD Pty Ltd (GHD) to undertake additional environmental monitoring at the FRNSW training facility located at Macknight Drive, Deniliquin (lot 48 of DP1189132), (the site) as well as a number of locations on neighbouring properties (the investigation area). The site boundaries are indicated in Figure 1 of Appendix A.

## **1.1 Site background**

The site serves as a training facility for fire fighters, which has included the historical use of aqueous film forming foam (AFFF), which potentially contained per- and poly-fluoroalkyl substances (PFAS), including perfluorooctane sulfonate (PFOS), perfluorooctanoic acid (PFOA), and perfluorohexane sulfonate (PFHxS).

The NSW Environment Protection Authority (NSW EPA) is leading an investigation programme to assess the legacy use of PFAS across NSW (NSW EPA, 2019). In 2016, the NSW EPA requested FRNSW undertake further investigation at the site to understand the potential for PFAS contamination.

A preliminary site investigation (PSI) was undertaken by GHD in 2016 (GHD, 2016) to identify potential sources of contamination and areas of potential concern. Findings of the PSI included identification of a number of source areas (e.g. areas where AFFF was used during training, and wash-down areas for contaminated equipment), potential exposure pathways, and potential human and ecological receptors.

Following completion of the PSI, an environmental site assessment (ESA) was undertaken by GHD between November 2016 and January 2017 (GHD, 2017a). A number of groundwater wells were installed, facilitating soil sampling, and subsequent groundwater, sediment, and surface water sampling was undertaken. Findings of the ESA included that soils and sediments at the FRNSW training facility have the potential to release PFAS to the environment, as indicated by leachability testing. PFAS was detected in off-site sediment samples, indicating that PFAS was likely to be migrating off-site via the man-made surface water drainage network in the area. The site was subsequently classified as a priority 1 site based on detections of PFAS in soil and surface water at concentrations exceeding trigger values, based on the EnRisk (2016) decision tree for prioritisation.

A phase 2 ESA was undertaken by GHD between May and June 2017 (GHD, 2017b). During this phase of works, three additional groundwater wells were installed both on the FRNSW training facility grounds (MW04) and on the surrounding land (MW05 and MW06). Sampling of soil, surface water, sediment, and groundwater was undertaken both on and off the FRNSW training facility grounds. Findings included that contamination was present at the site from historical use of AFFF products containing PFAS, and that although the primary sources of PFAS were no longer present, secondary sources included soil, sediment in surface water drainage channels, and surface water. Exceedances of assessment criteria in soil and groundwater were generally localised to the training facility.

## **1.2 Objective**

The objective of this stage of works is to obtain current monitoring data which can then be used to inform PFAS trend analysis and refine the conceptual site model (CSM).

## **1.3 Scope**

The scope of works undertaken to meet the investigation objectives were:

- Collection of samples from nominated sampling points
- Implementation of quality assurance (QA) and quality control (QC) procedures, including the collection of appropriate QA samples
- Preparation of this summary report, documenting the results of the monitoring event, including review of the existing data set and trend analysis, where appropriate
- Update the CSM, where appropriate

The works were undertaken in conjunction with a land and water use survey of surrounding properties to further inform the CSM. The findings of the land and water use survey are reported in GHD (2019a).

## **1.4 Limitations**

This report has been prepared by GHD for Fire and Rescue NSW and may only be used and relied on by Fire and Rescue NSW for the purpose agreed between GHD and the Fire and Rescue NSW as set out in section 1.2 of this report.

GHD otherwise disclaims responsibility to any person other than Fire and Rescue NSW arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally permissible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

The opinions, conclusions and any recommendations in this report are based on conditions encountered and information reviewed at the date of preparation of the report. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date that the report was prepared.

The opinions, conclusions and any recommendations in this report are based on assumptions made by GHD described in this report. GHD disclaims liability arising from any of the assumptions being incorrect.

The opinions, conclusions and any recommendations in this report are based on information obtained from, and testing undertaken at or in connection with, specific sample points. Site conditions at other parts of the site may be different from the site conditions found at the specific sample points.

Investigations undertaken in respect of this report are constrained by the particular site conditions, such as the location of buildings, services and vegetation. As a result, not all relevant site features and conditions may have been identified in this report.

Site conditions (including the presence of hazardous substances and/or site contamination) may change after the date of this Report. GHD does not accept responsibility arising from, or in connection with, any change to the site conditions. GHD is also not responsible for updating this report if the site conditions change.

## 2. Site Setting

### 2.1 Site identification

A summary of FRNSW site identification details are provided in Table 1. The site location is presented in Figure 1 in Appendix A

**Table 1 FRNSW Training Facility identification summary**

Information	Details
Street address	Macknight Drive, Deniliquin, NSW 2710
Lot and DP number	Lot 48 of deposit plan 1189132
Site area	Approximately 23,000 m <sup>2</sup> with a perimeter of approximately 610 m
Local government area	Deniliquin Council
Local land use zoning	IN1 – General Industrial
Current land use	Training facility
Ownership	The site is owned by Deniliquin Council and is leased by FRNSW for use as a training facility. The lease area has been occupied by FRNSW since 1996.

### 2.2 Surrounding land use

The surrounding land uses and local environment are summarised in Table 2-2 below.

**Table 2 Summary of surrounding land use and local environment**

Element	Description
Surrounding land use	Various properties including vacant land and some industrial / commercial properties to the north that are zoned as 'General Industrial (IN1)' or 'Infrastructure (SP2)'. Deniliquin Airport surrounds the site to the east, south and west, and is zoned as Infrastructure: Air Transport Facilities.
Topography	The regional topography appears to be mostly flat, with a slight fall from south-east to north-west. The investigation area lies approximately 96 metres Australian Height Datum (mAHD) and is relatively flat, except for some artificial grading around a former pool area.
Soils	The site is within the brown Chromosols landscape. The brown Chromosols landscape is found in sites with average rainfall between 0.35 m and 1.4 m. The soils have moderate agricultural potential, chemical fertility and soil drainage. The upper horizons are described as dark brown with up to 10% orange mottles, silty clay loam, grading into a dark brown medium heavy clay. There is a low probability of encountering acid sulphate containing soils.

### 2.3 Geology

The 1:250,000 scale Deniliquin geological map indicated the site is situated on the Shepparton Formation (Brown & Stephenson, 1991). The Shepparton Formation is described as unconsolidated to poorly consolidated, mottled, variegated clay, silty clay with lenses of polymictic, coarse to fine sand and gravel; partly modified by pedogenesis, includes intercalated red-brown palaeosols.

The presence of clays to approximately 14 m has been confirmed through previous site investigations (GHD, 2017b) and through bore logs from registered bores within the local area.

## 2.4 Hydrogeology

### 2.4.1 Groundwater aquifers

The site is located on Quaternary aged, Shepparton Formation, which is expected to form the primary water bearing aquifer unit in this area. According to the Deniliquin 1:250,000 scale Hydrogeological Map (Brown & Stephenson, 1991), the total dissolved solids (TDS) in the groundwater beneath the site is likely to be in the order of 1000 to 1500 mg/L, indicating it would be suitable for stock, domestic and some irrigation purposes. Additionally, bore yields were shown to be 0.5-5 L/s within the sand aquifer, with hydraulic conductivities between 5 to 10 m/day.

Groundwater quality parameters obtained during sampling undertaken in July 2019 indicated salinity ranging between 1574 and 11,445 µS/cm for bores located on and in the vicinity of the site, as detailed in Table 10. Salinity was above the stock water criteria (ANZECC, 2000) in MW04 onsite, and MW06, GW503702 and GW503704 offsite. Salinity was also within the *Australian Drinking Water Guidelines 6 2011* (NHMRC & NRMMC, 2018) ranges for ‘poor quality’ to ‘unacceptable’. Assessment against these criteria indicates that shallow groundwater is of limited beneficial use potential in this area. However, fresher water may be located closer to the township of Deniliquin and the Edward River where several production bores are located; these bores are more than 1.7 km east of the site. The bore records for these wells indicate salinities are less than the 1000 mg/L with yields above 1 L/s indicating that the aquifer is potentially of high beneficial use. The large number of wells in and around Edward River used for water supply purposes supports this interpretation.

Groundwater was encountered in monitoring wells between 12.14 and 16.9 metres below the top of casing (mbTOC) during groundwater gauging undertaken in July 2019. Based on this data, groundwater flow is inferred to be towards the north and northwest. The depth to groundwater at the site and the local geology (clays encountered up to 14 mbgl) indicate it is unlikely that groundwater is hydraulically connected to Mulwala Canal, located approximately 800 m to the north of the site. As groundwater is flowing in the general direction of the Edward River (i.e. north to north-west), it is possible that the Edward River is hydraulically connected with groundwater.

### 2.4.2 Existing groundwater bores

GHD conducted a review of existing groundwater borehole records using the Bureau of Meteorology (2019) *Australian Groundwater Explorer* in July 2017, and again in July 2019. The search was conducted to identify registered groundwater boreholes in close proximity to the site, and to record information such as use and standing water level.

No registered bores were located on the site but two groundwater monitoring bores were identified within a 500 metre radius of the site, located on the adjoining Deniliquin Airport to the east. Conversations with Deniliquin Airport staff indicated that these bores were required by the NSW EPA to enable groundwater monitoring in the vicinity of an evaporation pond on the airport grounds. These bores (GW503702 and GW503704) were purged and sampled during the July 2019 sampling event, with results reported within this document.

No other registered groundwater bores were located within one kilometre of the site. Based on the findings of the land and water use survey completed in conjunction with these works (GHD, 2019a), no groundwater bores are known to be present on properties down-gradient of the site, as discussed further in Section 2.6.

## **2.5 Hydrology**

A constructed irrigation watercourse, Mulwala Canal, runs approximately 800 m to the east and north of the site. It originates at Lake Mulwala (over 130 km to the south-east of the site), and diverts water from the Murray River across the southern Riverina plain to the Edward River at Deniliquin and beyond. The Mulwala canal supplies water to the southern Riverina towns Berrigan and Finley (both up gradient of the site), Bunnaloo and Wakool (down gradient of the site), as well as agricultural properties. The water level in Mulwala Canal is regulated and controlled via Yarrawonga Weir at Lake Mulwala. 'Irrigation season' for VIC and NSW Murray System channels usually extends from mid-August to mid-May, however the water level in the canal is ultimately driven by irrigators' demand for allocated water.

Artificial drainage channels exist on and off-site to direct surface water flows to dams located across the investigation area. Flow directions in drainage channels, based on observations during site inspections, are indicated in Figure 5 of Appendix A.

Surface water originating from the site is expected to enter the drainage channels adjacent to Macknight Drive, eventually discharging to a dam located approximately 200 m to the north-east of the site (i.e. near SW03 and SS07). The water level in this dam was observed to be low, and it appeared that its capacity had been increased recently as there was evidence of spoil adjacent to the dam. It is not known whether this dam overflows during periods of high rainfall; however, concentrations of PFAS above LOR in locations SS15/SW04 and SS08 indicate this may have occurred historically. Water that does not reach this off-site dam is likely to evaporate, or seep into the ground; but is not expected to flow to either the Edward River or Mulwala Canal. However, as the channels are discontinuous and terminate either alongside Macknight Drive or at the dam, stormwater runoff (e.g. from roads) is expected to flow into the drainage channels that run adjacent to roads in the investigation area (i.e. Saleyards Road, Macknight Drive, Cobb Highway).

Drainage channels in the east of the investigation area appear to connect to a channel that flows north along Cobb Highway, appearing to cross Cobb Highway approximately 50 m south of Mulwala Canal before flowing adjacent to the canal for approximately 1800 m and then discharging to it approximately 2.4 km southeast of the site.

The closest natural water body is Aljoes Creek located 2.5 km east of the site and appears to intersect Mulwala Canal approximately 4 km south-east of the site. Aljoes Creek discharges to Edward River located approximately 2.8 km to the east and north of the site.

Drinking water is supplied to Deniliquin from water that is extracted from the Edward River and treated at the Deniliquin water treatment plant prior to supply to the township.

## **2.6 Water use surveys**

Since the 2017, community engagement efforts have focused on consulting with property owners in the area surrounding the Deniliquin training facility to understand water use within the broader area. This has involved the distribution of fact sheets, and the hosting of a community meeting and information session on 23 May 2017.

Two water use surveys have been distributed to a sample set of landowners within the vicinity of the site, based on advice from the EPA, in both 2017 and 2019 (GHD, 2017b; GHD, 2019a). The findings from water use surveys are summarised as follows:

- All of the properties that responded to the survey were identified as Industrial/Commercial Agricultural
- All of the properties identified town water as their primary water source

- No properties indicated they have a bore on their property, or that they had ever used bore water
- No properties indicated they have ever used surface or dam water from their property
- None of the respondents indicated having animals or livestock living on their property
- None of the respondents indicated having irrigated land
- No respondents within the investigation area indicated that they have used local creeks for recreational purposes.

# **3. Methodology**

## **3.1 General**

Sampling activities were undertaken over three days, between 16 and 18 August 2019. Sampling activities included collection of groundwater, surface water and sediment samples, as well as collection of samples from a fire truck used in training activities that was located at the FRNSW Training Facility.

Sampling activities were undertaken in general accordance with:

- HEPA (2018) *PFAS National Environmental Management Plan*
- *National Environment Protection (Assessment of Site Contamination) Measure 1999*

## **3.2 Groundwater sampling**

The general methodology for groundwater sampling is summarised in Table 3.

**Table 3 Groundwater sampling methodology**

Stage	Description
Identification	Groundwater wells were identified using site figures and photographs from previous sampling activities. Four onsite wells (MW01-MW04), and four offsite wells (MW05-MW06, GW503702 and GW503704) were gauged and sampled.
Gauging	Wells were gauged using an interface probe, and the well depth measured The volume of water within the well was calculated to determine the volume of water required to be purged from the well prior to collection of samples.
Purging	Water was purged from wells using Teflon™ free disposable bailers, secured using a stainless steel tether line. Each bailer contains approximately one litre, and wells were purged until three volumes of water had been removed from the well. One exception to this was well MW04 which was exhibiting little recharge. As water quality parameters appeared relatively stable, and approximately six litres had been removed from the well, samples were collected prior to the removal of three volumes. Wells GW503702 and GW503704 located on the adjacent airport site were calculated to require removal of 105 and 81 litres of water respectively. As parameters had stabilised after removal of 12 and 18 litres respectively, and as recharge was good (i.e. the standing water level was stable), samples were collected prior to the removal of three volumes.
Field parameters	Field parameters were measured using a calibrated water quality meter, with measurements of temperature, pH, electrical conductivity (EC), dissolved oxygen (DO) and oxidation-reduction potential (ORP) recorded. Observations of turbidity, odour, sheen, and recharge were also recorded.
Sampling	All monitoring wells were grab sampled directly from the bailer.
Sample handling and transport	Following collection of samples, the sample bottles were placed on ice and stored in an insulated storage container (i.e. esky) prior to being forwarded to the analytical laboratory within the required holding time.

Stage	Description
Sample analysis	All groundwater samples were submitted for laboratory analysis of 30 PFAS analytes at the standard limit of reporting (LOR), as well as total dissolved solids (TDS).
Quality assurance and quality control (QA/QC)	A QA/QC sampling procedure was implemented, and is discussed in Section 6.
Water disposal	Purge water was collected in jerry cans and placed in a large (~300 L) hazardous materials plastic drum located at the site. GHD understands that there are a number of drums containing historical AFFF products to be collected from the site, and it is understood that the wastewater will be disposed of alongside these.

### 3.3 Surface water sampling

The general methodology for surface water sampling is summarised in Table 4.

**Table 4 Surface water sampling methodology**

Stage	Description
Identification	Surface water locations were identified using site figures. Eleven surface water locations were sampled (location SW12 was dry and unable to be sampled).
Field parameters	Field parameters were measured using a calibrated water quality meter, with measurements of temperature, pH, EC, DO and ORP recorded. Observations of turbidity, odour, and sheen were also recorded.
Sampling	All samples were collected via grab samples collected close to the water's edge using laboratory provided, plastic, unpreserved sample bottles. A new pair of nitrile gloves was worn for the collection of each sample.
Sample handling and transport	Following collection of samples, the sample bottles were placed on ice and stored in an insulated storage container (i.e. esky) prior to being forwarded to the analytical laboratory within the required holding time.
Sample analysis	All surface water samples were submitted for laboratory analysis of 30 PFAS analytes at the standard LOR.
QA/QC	A QA/QC sampling procedure was implemented, and is discussed in Section 6.

### 3.4 Sediment sampling

The general methodology for sediment sampling is summarised in Table 5.

**Table 5 Sediment sampling methodology**

Stage	Description
Identification	Sediment sampling locations were identified using site figures. Sediment was sampled from 19 locations.
Field observations	Field observations, including material description, and observations of anthropogenic inclusions, odour, or sheen were recorded.
Sampling	One sample was collected using a stainless steel hand auger with a sediment/sand head attachment. The remaining samples were collected via grab sample, as water was shallow. A new pair of nitrile gloves was worn for the collection of each sample, and sediment was transferred immediately to laboratory-supplied containers.

Stage	Description
Decontamination	The hand auger was decontaminated using a triple rinse procedure with deionised water.
Sample handling and transport	Following collection of samples, the sample bottles were placed on ice and stored in an insulated storage container (i.e. esky) prior to being forwarded to the analytical laboratory within the required holding time.
Sample analysis	All sediment samples were submitted for laboratory analysis of 30 PFAS analytes at the standard LOR, as well as TOC, and Standards Australia Leaching Procedure (ASLP).
QA/QC	A QA/QC sampling procedure was implemented, and is discussed in Section 6.

### 3.5 Fire truck sampling

The general methodology for collection of samples from the fire truck located at the FRNSW training facility is summarised in Table 6.

**Table 6 Fire truck sampling methodology**

Stage	Description
Identification	Samples were collected from three outlets located on the nearside of the fire truck.
Field observations	Field observations, including description of the liquid collected were recorded.
Sampling	Samples were collected by opening the ball valves or outlet caps, and the ensuing liquid being captured by laboratory supplied sample containers directly. A new pair of nitrile gloves were worn for the collection of each sample.
Sample handling and transport	Following collection of samples, the sample bottles were placed on ice and stored in an insulated storage container (i.e. esky) prior to being forwarded to the analytical laboratory within the required holding time.
Sample analysis	All samples collected from the fire truck were submitted for laboratory analysis of 30 PFAS analytes at the standard LOR, as well as TOC, and ASLP.
QA/QC	A QA/QC sampling procedure was implemented, and is discussed in Section 6.

## **4. Assessment Criteria**

### **4.1 Basis for assessment**

For the purpose of assessment of potential risk to human and ecological health due to PFAS contamination at the site, and in the surrounding man-made drainage channel network, assessment criteria were adopted directly from the HEPA (2018) *PFAS National Environmental Management Plan*.

HEPA (2018) represents a nationally-agreed suite of analytes for site investigations, and provides guidance values for protection of human and ecological health.

### **4.2 Rationale for assessment criteria**

According to *Sediment quality assessment: a practical guide* (Simpson & Batley, 2016), a sediment is defined as ‘unconsolidated mineral and organic particulate material that has settled to the bottom of aquatic environments’. All sediment samples were collected from constructed drainage lines that are not considered ‘aquatic environments’ in and of themselves. Therefore, the sediment samples collected in this investigation were assessed as soil against the adopted soil assessment criteria outlined in HEPA (2018), however continue to be referred to as ‘sediment’ for consistency with previous investigations undertaken at this site, and differentiation from soil samples collected from soil bores.

Analytical results for groundwater were assessed against the ecological criteria for freshwater, as it is considered that other freshwater surface water bodies (including Edwards River) are considered likely to be the end receptor for groundwater at the site. The 95% species protection scenario was adopted, as the area is considered to be a slightly-to-moderately disturbed ecosystem, due to the commercial operations in the area.

Analytical results for surface water were assessed against the ecological criteria for freshwater, as it is considered that other freshwater surface water bodies (including Mulwala Canal) are considered likely to be the end receptor for drainage channels in the east of the site. The 95% species protection scenario was adopted, as the area is considered to be a slightly-to-moderately disturbed ecosystem, due to the commercial operations in the area.

All of the responses to the land use surveys conducted in the area indicated that properties were connected to town water supply, and that surface water and bore water was not used for any purpose. Although GHD did not obtain responses from all properties within the investigation area, it is considered that proximity of the investigation area to Deniliquin township provides easy access to municipal water supply, and Deniliquin. This is supported by the consistency of the responses received. As such, surface water and groundwater were not assessed against drinking water criteria.

For each media, the assessment criteria for Industrial/Commercial land use were applied, as this is the zoning of the site and surrounding properties, as well as the functional use of land within the area.

### **4.3 Nominated assessment criteria**

#### **4.3.1 Surface water and groundwater**

Analytical results from surface water and groundwater samples were assessed against the criteria presented in Table 7.

**Table 7 Assessment criteria for surface water and groundwater**

Assessment criteria	PFOS µg/L	PFOA µg/L	Exposure scenario
Freshwater guideline values	0.13	220	95% species protection – slightly to moderately disturbed systems

#### 4.3.2 Sediment

Analytical results from sediment samples were assessed against the criteria presented in Table 8.

**Table 8 Assessment criteria for sediment**

Assessment criteria	PFOS/PFHxS (mg/kg)	PFOS (mg/kg)	PFOA (mg/kg)	Land use
Human health based guidance values	20	-	50	Industrial/commercial
Ecological guideline values	-	0.140	-	Industrial/commercial

# 5. Results

## 5.1 Groundwater results

### 5.1.1 Groundwater gauging results

Groundwater gauging results are summarised in Table 9. The top of casing (TOC) elevation for the wells previously installed by GHD (MW01-MW06) were surveyed previously, and were used to calculate the groundwater elevation in mAHD. Survey data was unavailable for groundwater wells GW503702 and GW503704.

Based on the gauging results, local groundwater at the site appears to be in a north to north-westerly direction.

**Table 9 Groundwater gauging data**

Well ID	TOC (mAHD)	Depth of well (m)	Depth to groundwater (mbTOC)	Groundwater elevation (mAHD)
MW01	93.688	12.14	12.14	81.55
MW02	92.682	12.75	12.75	79.93
MW03	92.810	16.9	16.9	75.91
MW04	93.515	13.73	13.73	79.79
MW05	93.757	13.42	13.42	80.34
MW06	93.668	12.8	12.8	80.87
GW503702	-	16.68	16.68	-
GW503704	-	15.69	15.69	-

### 5.1.2 Groundwater quality

Water quality parameters were recorded during the purging of the well to determine their stability, and whether it was appropriate to commence collection of samples. Stabilised parameters are summarised in Table 10.

**Table 10 Summary of groundwater quality parameters**

Well ID	pH	Temperature (°C)	EC (µS/cm)	DO (mg/L)	ORP <sup>^</sup> (mV)
MW01	7.30	20.1	2156	3.74	98.1
MW02	7.71	19.2	1574	6.17	94.3
MW03	7.68	18.8	2295	6.22	122.9
MW04	7.07	19.9	6080	4.81	110.0
MW05	7.42	19.9	2222	6.27	98.5
MW06	7.05	19.2	11445	1.69	-76.9
GW503702	7.51	19.0	7507	6.48	107.2
GW503704	7.40	18.6	9840	5.86	104.8

Notes: ^Oxidation-reduction potential

During purging, field observations were recorded. No hydrocarbon or chemical odours, or petroleum sheen were noted. A summary of field observations are provided in Table 11.

**Table 11 Groundwater field observation summary**

Well ID	Summary of observations
MW01	Purge water was clear with no sheen or odour. Some rootlets were extracted from the well during bailing.
MW02	Purge water was mildly turbid, coloured white. No sheen or odour were observed. Good recharge.
MW03	Water was mildly turbid, coloured pale yellow-brown, however this decreased during purging. No odour or sheen were observed. Good recharge.
MW04	Purge water was mildly turbid, coloured reddish brown. No sheen or odour were observed. Three volumes were not extracted prior to sampling due to poor recharge of the well. Parameters appeared stable following removal of six litres however, so sampling was commenced.
MW05	Water was mildly turbid, coloured white, which increased and became whitish-brown during purging. No sheen or odour were observed. Good recharge.
MW06	Water was turbid, coloured brown. Tree roots were extracted from the well during bailing and an organic odour was observed. Good recharge.
GW503702	Purge water was mildly turbid, coloured pale white, however this decreased during purging and water became clear. No odour or sheen were observed. Good recharge.
GW503704	Purge water was clear with no odour or sheen. Good recharge.

### 5.1.3 Analytical results

Samples were collected from a total of eight groundwater monitoring wells including:

- Four wells located on the FRNSW site (MW01 to MW04)
- Two off-site wells (MW05 and MW06) installed by GHD in 2017
- Two existing groundwater bores located adjacent to an evaporation pond located on the neighbouring Deniliquin Airport facility (GW503702 and GW503704).

In general, analytical results from all groundwater wells were below the laboratory limit of reporting, with the exception of MW01 and MW04. Criterion exceedances are summarised in Table 12, with analytical results are provided in Appendix B.

**Table 12 Summary of criteria exceedances for groundwater**

Well ID	Criterion	Analyte	Criterion value	Analytical result
MW01	Freshwater 95% (HEPA, 2018)	PFOS	0.13 µg/L	17 µg/L

### 5.1.4 Historical groundwater data

Insufficient data exists to enable statistical trend analysis using the Mann-Kendall toolkit (or other trend analysis programme). In lieu of this, a qualitative comparison of the analytical results with those collected in January and June of 2017 is provided in

Table 13. Overall, results are largely consistent with those reported during previous monitoring events with maximum PFAS concentrations reported in monitoring location MW01.

**Table 13 Qualitative comparison with historical data for groundwater**

Location ID	Observation	Results from July 2019
MW02, MW03, MW05, MW06	PFAS below LOR in January and/or June of 2017	No change

Location ID	Observation	Results from July 2019
MW01 and MW04	PFAS detected above LOR in January and/or June of 2017	No change
MW01	Highest concentration of PFOS detected	No change
MW01	Concentrations of PFOS exceeded HEPA (2018) Freshwater 95% assessment criteria	No change

## 5.2 Surface water results

### 5.2.1 Surface water quality

Water quality parameters were recorded during the collection of surface water samples, and are summarised in Table 14

**Table 14 Summary of surface water quality parameters**

Surface water ID	pH	Temperature (°C)	EC (µS/cm)	DO (mg/L)	ORP <sup>^</sup> (mV)
SW01	9.17	14.4	168.4	10.31	39.9
SW02	8.37	11.5	159.0	4.28	-57.1
SW03	7.97	11.1	194.3	9.24	51.7
SW04	7.06	11.9	350.8	1.02	-73.5
SW05	7.14	11.3	90.2	8.39	57.5
SW06	7.45	11.6	81.8	7.3	34.0
SW07	7.60	12.6	113.6	8.35	25.2
SW08	7.47	12.9	106.7	3.49	42.3
SW09	8.33	14.8	19.8	8.80	72.9
SW10	7.84	10.0	149.4	4.57	60.4
SW11	8.61	11.6	62.1	9.77	48.1
SW12	Sampling location dry				

Notes: ^Oxidation-reduction potential

During collection of surface water samples, field observations were recorded. No hydrocarbon or chemical odours or sheen were noted, however some bubbly foam was observed at location SW01, which may have been associated with the algal growth also observed at this location. A summary of field observations are provided in Table 15.

**Table 15 Surface water field observation summary**

Well ID	Summary of observations
SW01	Surface of water was bubbly/foamy, with brownish-green algal growth.
SW02	Water was clear (low turbidity). No odour or sheen were observed.
SW03	High turbidity, water coloured pale brown. No odour or sheen observed.
SW04	Water had low turbidity, coloured brown-grey. Sediment settled out quickly. No odour or sheen observed.
SW05	Water was clear, with no odour or sheen.
SW06	Water was clear, with no odour or sheen.
SW07	High turbidity, coloured whitish-brown. No odour or sheen were observed.
SW08	Mild turbidity, coloured brown-grey. No sheen or odour were observed.
SW09	Water was turbid, coloured brown-grey. No odour or sheen were observed. Very little water – was collected using a syringe.

Well ID	Summary of observations
SW10	Water was turbid, coloured grey. No sheen or odour observed.
SW11	Water was turbid, coloured pale brown. No sheen or odour were observed.
SW12	Sampling location dry

### 5.2.2 Analytical results

Samples were collected from 11 surface water locations, all located off-site. One location, SW12, was observed to be dry.

Analytical results from seven of the 11 surface water samples were observed to exceed the assessment criteria. Concentrations above LOR ranged between 0.02 µg/L and 0.86 µg/L, with the highest concentration observed in location SW03, approximately 200 m north-east of the site. Criterion exceedances are summarised in Table 16, with analytical results provided in Appendix B.

**Table 16 Summary of criteria exceedances for surface water**

Criterion	Number of exceedances	Analyte	Criterion value (µg/L)	Maximum concentration (µg/L)
Freshwater 95% (HEPA, 2018)	7 of 11	PFOS	0.13	0.83

### 5.2.3 Historical surface water data

Insufficient data exists to enable statistical trend analysis using the Mann-Kendall toolkit (or other trend analysis programme). In lieu of this, a qualitative comparison of the analytical results with those collected in December 2016 and May of 2017 is provided in Table 17. In general, surface water results were largely consistent with the results obtained during previous rounds of monitoring.

**Table 17 Qualitative comparison of historical data for surface water**

Location ID	Observation	Results from July 2019
SW11	PFAS below LOR	No change
SW01, SW02, SW03, SW04, SW06, SW08, SW10	PFAS detected above LOR	No change
SW01, SW02, SW03, SW04, SW06, SW08	Concentrations of PFOS exceeded HEPA (2018) Freshwater 95% assessment criteria	No change
SW07, SW09	Sample location dry, unable to sample	Not dry – sample collected

## 5.3 Sediment results

### 5.3.1 Observations

Sediment samples were collected from 19 locations both onsite (SS01, SS02, and SS14) and offsite (SS03-SS13, and SS15-SS19). Material was generally observed to be clay, sandy clay or gravelly clay, with a clayey gravel observed at one location (SS02).

The sediment material ranged between pale grey to medium grey-brown to dark brown in colour, with variously low to high plasticity.

Glass was observed at one location (SS04), with rootlets in a number of other locations, however no other anthropogenic material was observed. A moderately strong organic odour was observed at SS15, however no other odours were observed.

Location SS14 (onsite) was a concrete lined spoon drain containing no sediment. The sample in this location was collected from a break in the concrete wall.

The drainage channel at location SS02 (onsite) was poorly defined.

### 5.3.2 Analytical results

Analytical results from two of the 19 sediment samples were observed to exceed the ecological assessment criteria for PFOS. Concentrations above LOR for PFOS ranged between 6.6 µg/kg and 5000 µg/kg. The two highest concentrations were observed at onsite locations SS01 (5000 µg/kg), and SS02 (1600 µg/kg). Criterion exceedances are summarised in Table 18, with analytical results provided in Appendix B.

**Table 18 Summary of criteria exceedances for sediment**

Criterion	Number of exceedances	Analyte	Criterion value (µg/kg)	Maximum concentration (µg/kg)
Ecological indirect exposure commercial/industrial (HEPA, 2018)	2 of 19	PFOS	140	5000

### 5.3.3 Leachability results

In addition to analysis for the 30 PFAS analytes, all sediment samples were also analysed using ASLP. HEPA (2018) do not describe assessment criteria for leachability results and as such, a qualitative assessment of these is provided in Table 19. Analytical results are provided in Appendix B.

**Table 19 Qualitative assessment of leachability results**

Analyte	Summary
Perfluoroctane sulfonic acid (PFOS)	Concentrations above the LOR in all samples except SS17 (located east of Cobb Highway) Highest concentrations of PFOS were detected in onsite samples SS01 (510 µg/L) and SS02 (87 µg/L) Analytical results Offsite samples ranged between <0.01 µg/L (SS17) and 1.9 µg/L (SS08)
Perfluorohexane sulfonic acid (PFHxS)	Concentrations above the LOR were observed in samples collected from onsite locations SS01 (7.1 µg/L), SS02 (2.7 µg/L) and SS14 (0.03 µg/L), as well as in off-site locations SS05 (0.01 µg/L) and SS08 (0.01 µg/L)
Perfluoroctanoic acid (PFOA)	Concentrations above the LOR were observed in samples collected from onsite locations SS01 (1.3 µg/L) and SS02 (1.0 µg/L), as well as off-site location SS05 (0.02 µg/L)

### 5.3.4 Historical sediment data

Insufficient data exists to enable statistical trend analysis using the Mann-Kendall toolkit (or other trend analysis programme). In lieu of this, a qualitative comparison of the analytical results with those collected in November 2016 or May of 2017 is provided in Table 20.

**Table 20 Qualitative comparison of historical data for surface water**

Location ID	Observation	Results from July 2019
SS01, SS02, SS03, SS04, SS05, SS06, SS08, SS09, SS10	PFAS detected above LOR	
SS07, SS11, SS12, SS13, SS16, SS17, SS18	PFAS detected above LOR	Non detect (<LOR)
SS01, SS02	Concentrations of PFOS exceeded HEPA (2018) ecological assessment criteria	No change
SS01, SS02	Analytical results	Analytical results were observed to be 1-2 orders of magnitude higher than previously recorded.
All locations	Human health assessment criteria not exceeded	No change

## 5.4 Fire truck results

### 5.4.1 Observations

One fire truck was located at the FRNSW training facility. According to the site contact, the truck is used for training activities. Identification details of the fire truck are summarised in Table 21.

**Table 21 Fire truck identification**

Truck type	Truck ID	Year	Service location	Licence plate
2 Urban Pumper	10492	August 2002	FRNSW Training Facility Deniliquin	BF09BL

Samples were collected on 18 July 2019 from three outlets on the truck's nearside (i.e. passenger or left hand side of the truck). Two outlets were also located on the truck's offside (i.e. driver's or right hand side of the truck side); the site contact indicated that these were identical to the nearside outlets, and that a splitter routed tank water to either side, depending on the fire-fighting needs (e.g. location and proximity to fire), but that the water tank was common to both sides. Sample identification and descriptions are provided in Table 22

**Table 22 Fire truck sample descriptions**

Sample ID	Sample location	Sample description
10492_RNSD1	Rear, nearside Delivery 1	Water, yellow-brown but clear. No odour or sheen.
10492_RNSD2	Rear, nearside Delivery 2	Water, yellow-brown but clear. No odour or sheen. Duplicate sample FTBD01 and FTSD01 collected
10492_RNCBFO	Rear, nearside, Class B foam outlet	Thick brown liquid, high viscosity. Less than 5 mL collected.

### 5.4.2 Analytical results

PFAS was detected at concentrations above the laboratory LOR in all three samples analysed.

The maximum concentrations of PFOS, PFHxS and PFOA, as well as 6:2 Fluorotelomer Sulfonate (6:2 FTS), were observed in the sample collected from the Class B foam outlet, and were approximately four orders of magnitude greater than concentrations of these compounds in samples collected from the Delivery 1 and Delivery 2 outlets.

Analytical results for the fire truck sampling are presented in Appendix B and are summarised in Table 23.

**Table 23 Summary of fire truck sampling analytical results**

Sample ID	PFOS (µg/L)	PFHxS (µg/L)	PFOA (µg/L)	6:2 FTS (µg/L)	PFAS (sum of total) (µg/L)
10492_RNCBFO	1,900	330	190	16,000	20,700
10492_RNSD1	0.18	0.05	0.05	1.2	2.55
10492_RNSD2	0.30	0.01	<0.01	<0.05	0.33

# 6. Quality assurance and quality control

## 6.1 Field quality assurance and quality control

All fieldwork was conducted in general accordance with GHD standard operating procedures (SOPs), which facilitate the collection of representative environmental samples by using uniform and systematic methods. Key requirements of these procedures are described in Table 24.

**Table 24 Summary of QA/QC field procedures**

Procedure	Description
Dedicated sampling equipment	To mitigate the risk of cross-contamination between samples, new disposable gloves were worn for the collection of each sample. Hand augers were decontaminated between collection of samples.
Calibrated field equipment	The water-quality meter was calibrated by the rental supplier, as was the interface probe. Calibration certificates are provided in Appendix C.
Sample identification procedures	Sample containers were clearly labelled with a unique sample identification number referring to the sample location and depth of sample collection (where appropriate), date, and sampler's initials.
Sample storage	Sample containers were transferred to an ice-filled insulated cooler (i.e. esky) for preservation prior and during shipment to the testing laboratory.
Chain of custody protocols	A chain of custody form was completed and provided to the testing laboratory with the samples, tracking the delivery times and conditions of sample delivery and receipt.

## 6.2 Data quality indicators

Data obtained during this investigation was assessed to determine whether it could be relied upon to make decisions. Acceptance criteria for this investigation were in general accordance with limits described in Standards Australia (2005) AS4482.1 *Guide to the investigation and sampling of sites with potentially contaminated soil - Part 1: Non-volatile and semi-volatile compounds*, and GHD's SOP for *Verification of Analytical Results* (GHD, 2014a) and *Quality Assurance Sampling* (GHD, 2014b).

The data quality indicators and acceptance criteria are summarised in Table 25 and discussed in detail below.

**Table 25 Summary of data quality objectives and indicators**

Data quality objective	Data quality indicator
Precision	Duplicate samples were collected at a rate consistent with recommendations in HEPA (2018), with one intra-laboratory sample and one inter-laboratory sample collected per 10 primary samples collected. Intra-laboratory samples were submitted to the primary laboratory for analysis, with the inter-laboratory samples submitted to a selected secondary laboratory for analysis.

Data quality objective	Data quality indicator
Accuracy	<p>The hand auger was decontaminated using a triple-rinse decontamination process using deionised water.</p> <p>The hand auger was only required for collection of one sediment sample, as such, only one rinsate sample was collected.</p> <p>This was collected by pouring deionised water across the decontaminated hand auger and into the sample container for analysis.</p>
Representativeness	<p>Sample jars for collection of primary samples and QA/QC assessment were sourced from the primary laboratory, and were of an appropriate size and material for the required analysis.</p> <p>Sampling activities were undertaken by field staff with appropriate experience in collecting environmental samples, and in particular, collection of samples pertaining to investigation of PFAS impacted sites.</p> <p>Samples were collected in accordance with GHD's standard operating procedures.</p> <p>All samples were submitted and analytes extracted and analysed within the holding time.</p> <p>The limits of reporting were equal to or below the assessment criteria for all analytes.</p>
Comparability	Laboratory analysis was undertaken by NATA accredited laboratories for both primary analysis (i.e. Eurofins   mgt, NATA accreditation: 1261) and secondary analysis (i.e. ALS Environmental, NATA accreditation: 825).
Completeness	<p>Sample descriptions were complete and appropriate.</p> <p>The chain of custody documentation and procedures were completed and remained unbroken.</p> <p>One intra-laboratory sample was analysed and one inter-laboratory sample was analysed out of eight primary groundwater samples. This gives an individual ratio of 12% each, which exceeds the minimum recommendation of 10%.</p> <p>Two intra-laboratory samples and two inter-laboratory samples were analysed out of 11 primary surface water samples. This gives an individual ratio of 18% each, which exceeds the minimum recommendation of 10%.</p> <p>Two intra-laboratory samples and two inter-laboratory samples were analysed out of 19 primary sediment samples. This gives an individual ratio of 10.5 % each, which exceeds the minimum recommendation of 10%.</p>

### 6.2.1 Rinsate analytical results

The hand auger used for sediment sampling was decontaminated using a triple-rinse decontamination process using deionised water.

Rinsate sample RIN01 was collected by pouring deionised water across the hand auger and into the sample container for analysis.

Analytical results for RIN01 were below the laboratory limit of reporting for all analytes, indicating that cross-contamination between sampling locations was unlikely to have occurred, due to effective decontamination procedures. These results are summarised in Appendix B.

## **6.2.2 Duplicate sample analytical results**

Relative percentage difference (RPD) calculations are a quantitative measure of the accuracy of the analytical results. Standards Australia (2005) describe an acceptable RPD as <30 to 50 percent, though it is noted that the variation may be higher for organic analysis, and for low concentrations of analytes. Where a result is below the LOR for one of the paired samples, the concentration assigned to that sample is the LOR. Where both results are reported below the LOR, the RPD is not calculated.

RPD summary tables are provided in Appendix B.

### ***Groundwater***

No RPD results greater than 0% were calculated.

### ***Surface water***

Of the 150 RPDs calculated for surface water, five RPD results exceeded the acceptance criterion of <30-50% for samples SW11 and SWSD02. These ranged between 100-179% for a number of PFAS compounds, which included PFOS and 6:2 FTS.

As the concentration of PFOS in SWSD02 was 0.05 µg/L which is one order of magnitude lower than the assessment criterion (compared to the non-detection for SW11), and as the majority of RPDs calculated for surface water duplicate samples met the acceptance criterion, this RPD is not considered to affect the outcomes of this investigation.

### ***Sediment***

Of the 150 RPDs calculated for sediment, one RPD result exceeded the acceptance criterion of <30-50%. The RPD was calculated to be 145% for PFOS between samples SS04 and SSSD02. As both of these results were more at least one order of magnitude below the assessment criteria for PFOS, and as the remaining RPD calculated for sediment duplicate samples met the acceptance criterion, this RPD is not considered to affect the outcomes of this investigation.

### ***Fire truck***

Of the 70 RPDs calculated for surface water, two RPD results exceeded the acceptance criterion of <30-50%. The RPDs for PFOS was calculated to be 164% and 187% for the inter-laboratory and intra-laboratory samples respectively.

As the highest concentration for PFOS was reported for the primary sample, this is considered the most conservative result, and this RPD is not considered to affect the outcome of this investigation.

## **6.2.3 Completeness**

Sample descriptions as provided were complete and appropriate. The chain of custody documentation and procedure was completed and remained unbroken.

Sufficient intra-laboratory and inter-laboratory duplicate samples were collected and analysed to meet the minimum requirements. No critical RPD results were observed that would affect the outcome of this investigation.

No critical samples are considered to exist for this data set. The data obtained for this investigation is considered valid and suitable to be relied upon for the purposes of this investigation.

## **7. Conceptual site model**

### **7.1 Conceptual site model**

A preliminary CSM was developed and updated by GHD during the PSI, ESA, and Phase 2 ESA undertaken by GHD (GHD, 2016; GHD, 2017a; GHD, 2017b). The CSM has been updated based on the findings from this investigation, as well as additional information presented in *Water use survey outcomes* (GHD, 2019a). A summary of the CSM is provided in Table 26.

**Table 26 Conceptual site model**

Potential source	Pathway	Receptor	Pathway complete	Modification of CSM from previous
Soils in firefighting training area	Direct contact	FRNSW commercial workers	<b>Unlikely</b> – PFAS impact detected previously in shallow soil samples collected from this area (SB01-SB04) however, impact reported below adopted human health assessment criteria.	Not assessed as part of this investigation
		Intrusive maintenance workers		
		On site ecology	<b>Possible</b> – shallow soil (SB06) and sediment (SS01 and SS02) samples exceed adopted ecological guidelines for commercial/ industrial land use.	No change
	Vertical migration of leachate through unsaturated zone	Groundwater	<b>Yes</b> – PFAS impact reported in MW01 located in the training area and MW04, north-east of the main source zone.	No change
	Surface water runoff	Surface water within drainage channels, and ultimately the off-site dam to the north of the site.	<b>Yes</b> – PFAS detected in surface water and some sediment samples within drainage channels in the investigation area in excess of the adopted ecological guidelines	No change
PFAS impacted sediments in offsite surface water drainage channels	Vertical/horizontal migration of leachate into surface water and through unsaturated zone into groundwater	Groundwater	<b>Unlikely</b> – groundwater bores do not exist in the vicinity of offsite sediment samples where ASLP results were above LOR. Concentrations were low, however, and may indicate that PFAS is not leaching into groundwater from impacted offsite sediments.	Added to CSM
		Surface water	<b>Yes</b> – concentrations of PFOS were observed to be above the HEPA (2018) freshwater assessment criteria in a number of surface water samples co-located with high concentrations of PFOS in sediment and/or leachable concentrations of PFOS.	Added to CSM

Potential source	Pathway	Receptor	Pathway complete	Modification of CSM from previous
PFAS impacted groundwater	Vertical/horizontal migration	Down gradient surface waters recharged by groundwater	<b>No</b> – PFAS concentrations were detected above adopted ecological assessment criteria in groundwater in MW01, however concentrations above the assessment criteria was not observed in hydraulically down-gradient wells to the north, or north-west of this well, suggesting that impact to groundwater has been delineated, and that migration to surface water receptors beyond these bores is unlikely. This is consistent with historical analytical results.	Changed from 'unlikely' to 'no'
		Abstraction bores (stock and/or domestic use)	<b>No</b> - PFAS impact detected above laboratory LOR appears highly localised to MW01 and, to a lesser extent, MW04 and is delineated to the north and east of these locations. In addition, results of the water use survey (GHD, 2019a) indicate no groundwater use for domestic or stock use in the investigation area.	Changed from 'unlikely' to 'no'
PFAS impacted surface water	Vertical migration	Groundwater	<b>Unlikely</b> - groundwater bores do not exist in the vicinity of offsite surface water samples, however, as groundwater is encountered at depths of more than 12 mbgl in the investigation area, potential impact to groundwater via vertical migration from impacted surface waters is considered unlikely.	Added
		Sediment	<b>Yes</b> – concentrations of PFAS were detected at above the LOR in many of the sediment sampling locations within the investigation area	Added
	Dermal contact and incidental ingestion	Recreational users, stock and/or livestock	<b>No</b> – GHD (2019a) indicated that surface water was not utilised in any way by site users.  GHD (2019a) also found that none of the survey respondents indicated having animals or livestock living on their property. During the site investigation, GHD staff did not observe any livestock within the investigation area.	Change from 'Yes' to 'Unlikely' based upon site observations and results from the GHD (2019a) water use survey.

Potential source	Pathway	Receptor	Pathway complete	Modification of CSM from previous
Migration via surface water flows into receiving water bodies including Mulwala Canal (Edward River and Aljoes Creek are not expected to be receiving water bodies for this site)	Rural commercial/ industrial properties, including human users and agricultural livestock outside of the investigation area	No – PFAS was not detected in Mulwala Canal at concentrations above LOR. Concentrations of PFAS in samples collected from surface water in drainage channels from the investigation area close to where water is expected to migrate off-site were below the LOR and/or assessment criterion.	CSM updated to include this potential source-receptor pathway	
			Aquatic ecosystems in receiving water bodies	No – PFAS was not detected in Mulwala Canal at concentrations above LOR. Concentrations of PFAS in samples collected from surface water in drainage channels from the investigation area close to where water is expected to migrate off-site were below the LOR and/or assessment criterion.
Storage of AFFF	Dermal contact, vertical/horizontal migration of leachate through unsaturated zone, and/or surface runoff and sediment transport	FRNSW commercial workers, intrusive maintenance workers, groundwater, surface water, off-site rural commercial/ industrial properties, and off-site ecological (terrestrial and aquatic)	Possible – PFAS present in soil and groundwater at MW04, east of the AFFF storage area. However, no impact observed in down gradient monitoring well (MW06), therefore substantial migration to the north-east is unlikely.	No change
Former pool area, now used for confined space training	Dermal contact, vertical/horizontal migration of leachate through unsaturated zone, and/or surface runoff and sediment transport	FRNSW commercial workers, intrusive maintenance workers, groundwater, surface water, off-site rural commercial/ industrial properties, and off-site ecological (terrestrial and aquatic)	Unlikely – PFAS concentration less than the LOR in deep soil samples from around the former pool (MW03, SB06 and SB07) suggesting that PFAS impact at these locations is likely to have been from surface activities and not the underground pool.	Not assessed as part of this investigation

Potential source	Pathway	Receptor	Pathway complete	Modification of CSM from previous
Liquids containing PFAS and/or AFFF concentrate	Direct contact with PFAS impacted liquid or aerosols discharged from fire trucks during training activities or maintenance works	FRNSW instructors and/or trainees during training activities. Maintenance workers undertaking maintenance of the vehicle	<b>Possible</b> – PFAS compounds were detected in each of the sample points, with the highest concentrations observed in the sample collected from the rear, nearside (passenger side) Class B foam outlet. Concentrations of selected PFAS analytes (i.e. PFOS, PFHxS, PFOA and 6:2 FTS) in this sample were four orders of magnitude greater than concentrations of these analytes obtained from the water delivery outlets.	Added
	PFAS impacted liquids entering the environment through release of tank liquid onto ground surfaces, entry into drainage channels, and/or vertical migration into groundwater	Surface soils, surface water in drainage channels, groundwater	<b>Possible</b> – it is expected that training activities involving discharge of liquids to the environment are undertaken at the FRNSW training facility (the site), and continuous discharges may be acting as an ongoing source of contamination to the environment within the training grounds.	Added

## **8. Discussion**

### **8.1 Discussion of key findings**

#### **8.1.1 Groundwater**

Groundwater was generally observed to have good recharge, with mild to high turbidity. No contaminant indicators (e.g. chemical odours or sheen) were observed during purging of groundwater wells.

The HEPA (2018) Freshwater 95% criterion was exceeded in one groundwater well, MW01, located on site. This is consistent with historical analytical results for this well. Concentrations of PFAS above the laboratory LOR were only recorded in one other onsite monitoring well, MW04, located to the north east of MW01. Concentrations of PFOS in groundwater at MW01 were three orders of magnitude higher than concentrations reported in MW04.

GHD consider that the impacts in groundwater are highly localised, and that the impact in MW01 has been delineated to the east by MW05, and hydraulically down-gradient to the north and north-west by MW04, MW03 and MW02. Hydraulic connectivity is not expected between groundwater at the site and Mulwala Canal, and though it is considered possible that groundwater is connected with the Edward River, as PFAS has been shown to be highly localised, it is considered unlikely that PFAS is entering the Edward River system. The potential for vertical migration of PFAS to groundwater from impacted sediment or surface water sources (on-site and off-site) is considered unlikely based on concentrations reported, leachability data and depth to groundwater.

Whilst the extent of PFAS impact to the south of MW01 is not fully understood, it is noted that the groundwater flow directions is inferred to be towards the north and north-westerly direction. Further, no users of groundwater or sensitive receptors have been identified to the south of the site.

#### **8.1.2 Surface water**

Surface water turbidity ranged across the locations from clear (low turbidity) to highly turbid, but did not appear to be associate with flow rate. No sheen or odour was observed at any location.

The surface of the water near SW01 was observed to be bubbly/foamy. Although PFAS was detected at concentrations above the laboratory LOR in this location, the results were comparable to concentrations reported at other locations, as well as an order of magnitude lower than the previous analytical results from sampling at this location undertaken in November 2016. Field observations from this location may have been attributed to algal growth which was also noted during sampling.

A complete pathway remains valid in the CSM for potential PFAS exposure to ecological receptors via surface water in drainage channels located within the investigation area.

There is not considered to be a complete pathway between PFAS impacted surface water at the site and within the investigation area, and Mulwala Canal, the Edward River, or Aljoes Creek however. This is due to concentrations for PFAS observed to be below the LOR and/or HEPA (2018) Freshwater 95% assessment criterion in samples collected from Mulwala Canal (SW11) and samples collected adjacent to Cobb Highway (SW09 and SW10). Locations SW09 and SW10 are close to where the surface water drainage channels are assumed to cross Cobb Highway before flowing adjacent to the canal for approximately 1800 m, prior to discharging to it approximately 2.4 km southeast of the site.

HEPA (2018) recommends sampling aquatic and other biota to assess the potential for bioaccumulation wherever a plausible transport pathway from a contaminated source exists, even if water concentrations are below the LOR. GHD notes that the ecology utilising the drainage channels in the investigation area is not fully understood, (outside the scope of this current and previous stages of investigation) and consideration of potential ecological receptors within the area would be prudent before progressing a potentially unnecessary biota sampling program.

Analytical results were below the LOR for all individual PFAS analytes in the sample collected from Mulwala Canal (SW11) and is consistent with previous analytical results (GHD, 2017b)..

Based on results of the GHD (2019a) water use survey, commercial properties do not use surface water for stock watering or domestic purposes.

### **8.1.3 Sediment**

Anthropogenic inclusions (glass) were observed at one sediment location, SS04, however no other contaminant indicators (e.g. chemical odour or sheen) were observed.

Analytical results exceeded the HEPA (2018) ecological criteria for commercial/industrial land use in two of the 19 samples collected (SS01 and SS02). Both of these samples were collected onsite from surface water channels that are very poorly defined; these locations previously reported concentrations of PFAS above the ecological screening criteria.

GHD notes that the results for SS01 and SS02 obtained from the current sampling event were more than an order of magnitude higher than those recorded during previous events. This suggests sediments may be acting as an on-going source of PFAS impact, with the potential for off-site discharge via surface water flow following heavy rainfall. It is possible that ongoing training events using fire truck 10492 (shown to contain PFAS impacted water and AFFF concentrate) may be acting as an ongoing contaminant source in this area. Conversations with the FRNSW site contact indicated this area was historically a basin or low-point at the site, where AFFF would often pool in following training events and may be continuing to do so.

Results from ASLP testing of sediment samples indicated that sediment both on and offsite may be acting as an ongoing source, with a number of PFAS analytes above the LOR. The implications of this are that PFAS is likely to be leaching from impacted sediments into surface water both on and offsite, and potentially into groundwater at the site. This is consistent with previous ASLP analytical results obtained from soil samples for the site (GHD, 2017b). The highest ASLP results were observed in onsite locations SS01 and SS02. Offsite location SS08 was observed to have higher concentrations of PFAS in leachability results than SS06 and SS07, which are located nearer to the site. SS08 was observed to be only slightly moist, with the channel poorly defined in this area, and no surface water observed. The higher concentrations in SS08 may therefore able to be explained by concentration of PFAS analytes due to evaporation of water. From site observations, it is not expected that there is a secondary source or alternative transport pathway to this location (e.g. an additional stormwater channel).

### **8.1.4 Fire truck sampling**

Insufficient liquid was collected for sample 10492\_RNCBFO to be analysed by the laboratory. It was decided that the liquid would be diluted to enable analysis, which would necessarily raise the LOR and potentially provide limited information (e.g. if assessed against assessment criteria with values lower than the raised LOR). The highest concentration of all analytes were observed in this sample, except where the LOR was raised significantly (i.e. one to two orders of magnitude) above the concentrations detected in the other two samples. This sample was collected directly from the foam outlet.

Concentrations of PFAS observed in samples collected from the two water outlets were generally observed to be four orders of magnitude lower than that collected from the Class B foam outlet, as could be expected due to dilution of foam within the truck's water tank.

Water from the water outlets and concentrate from the foam outlet are considered to be potential sources of contamination, however the contamination in the water outlet is likely to originate from water cycling through the foam tank where the concentrate. Potential receptors are considered to be both environmental and human (FRNSW personnel including training scenarios, operational use and maintenance).

Discharge to the environment may occur during accidental releases, maintenance activities, or training activities at the site and may be acting as an ongoing source of contamination to sediment and groundwater at the site.

Discharges may also occur near the FRNSW training offices where the truck is garaged, and may have caused surface soils and surface water near these offices to be impacted. Environmental investigation have not previously targeted this area.

Human receptors, including FRNSW instructors and trainees, are likely to be exposed to PFAS impacted water or AFFF concentrate via direct contact during training activities. Staff responsible for maintenance of the fire truck may also be exposed via direct contact during maintenance activities, or other tasks requiring operation of the truck's water or foam outlets.

GHD is currently in the process of delivering a human health risk assessment (HHRA) for FRNSW personnel based on potential exposure during operational, training and maintenance works. The works were not finalised at the time of this report however preliminary review of the data against the risk based threshold levels developed in the GHD (2019b) *FRNSW PFAS Investigations: Fire Truck Sampling and Threshold Derivations* indicate that sample collected from the Class B foam outlet would present a potential risk to human health under a training, operational and maintenance scenario. Concentrations in the water samples collected from outlets were orders of magnitude lower and below the draft risk based threshold levels developed by GHD. The results of the sampling of the fire truck from Deniliquin should be reviewed with reference to the outcomes of the risk assessment once works are finalised, including consideration of how FRNSW personnel may be exposed to discharge from the class B foam outlet, if at all.

# **9. Conclusions and recommendations**

## **9.1 Conclusions**

The objective of this investigation was to obtain current monitoring data to inform PFAS trend analysis and refine the CSM. The findings of these works support the previous conclusion that the site contains contamination from historical use of AFFF products containing PFAS. The primary sources of PFAS (foam products) are no longer present on site; however secondary sources of PFAS including impact to soil, drain sediment and surface water remain.

Based on the scope of works presented in Section 1.3, and subject to the limitations outlined in Section 1.4, the following conclusions are made:

- Potential risks associated with the presence of PFAS in groundwater on-site are considered to be low, based on the following lines of evidence:
  - Groundwater is not extracted for use on site
  - PFAS impact in groundwater is considered to be delineated and migration to potential surface water receiving bodies beyond these bores is considered unlikely based on available data, depth to groundwater and the inferred direction of groundwater flow.
  - Based on the outcomes of the water use survey, and discussions with local personnel, groundwater is not used for domestic or stock purposes in the investigation area.
- PFAS is present in off-site surface water at concentrations exceeding ecological investigation levels. Results were largely consistent with previous sampling events and detections of PFAS in surface water typically corresponded with elevated levels of PFAS in sediments at the same locations. Whilst livestock are not kept on any properties within the investigation areas, potential risks to ecological receptors, including birds, cannot be discounted.
- The potential for migration of PFAS via surface water to receptors including Edward River and Mulwala Canal is considered unlikely. This is further supported by the following lines of evidence:
  - Concentrations of PFAS in surface water drainage channels, collected from areas close to where water would be expected to further migrate, were below the LOR and/or assessment criterion.
  - PFAS was not detected in Mulwala Canal at concentrations above LOR.
- Whilst PFAS is present in on-site soils, concentrations were below criteria for the protection of human health. Based on the available data and our understanding of site operations by FRNSW personnel, potential risks of exposure under the currently commercial land use scenario are considered to be low.
- PFAS is present in samples collected from the fire truck based at the Deniliquin site. Whilst concentrations in water outlet locations do not exceed the draft risk based threshold levels developed by GHD (2019b) under another program of works, elevated results were reported in the Class B foam outlet. There is the potential for exposure to FRNSW personnel during training / maintenance activities or for PFAS impact from fire trucks to enter the environment, potentially acting as an ongoing source of contamination.

## **9.2 Recommendations**

Based on the findings of these and previous works, the following recommendations are made:

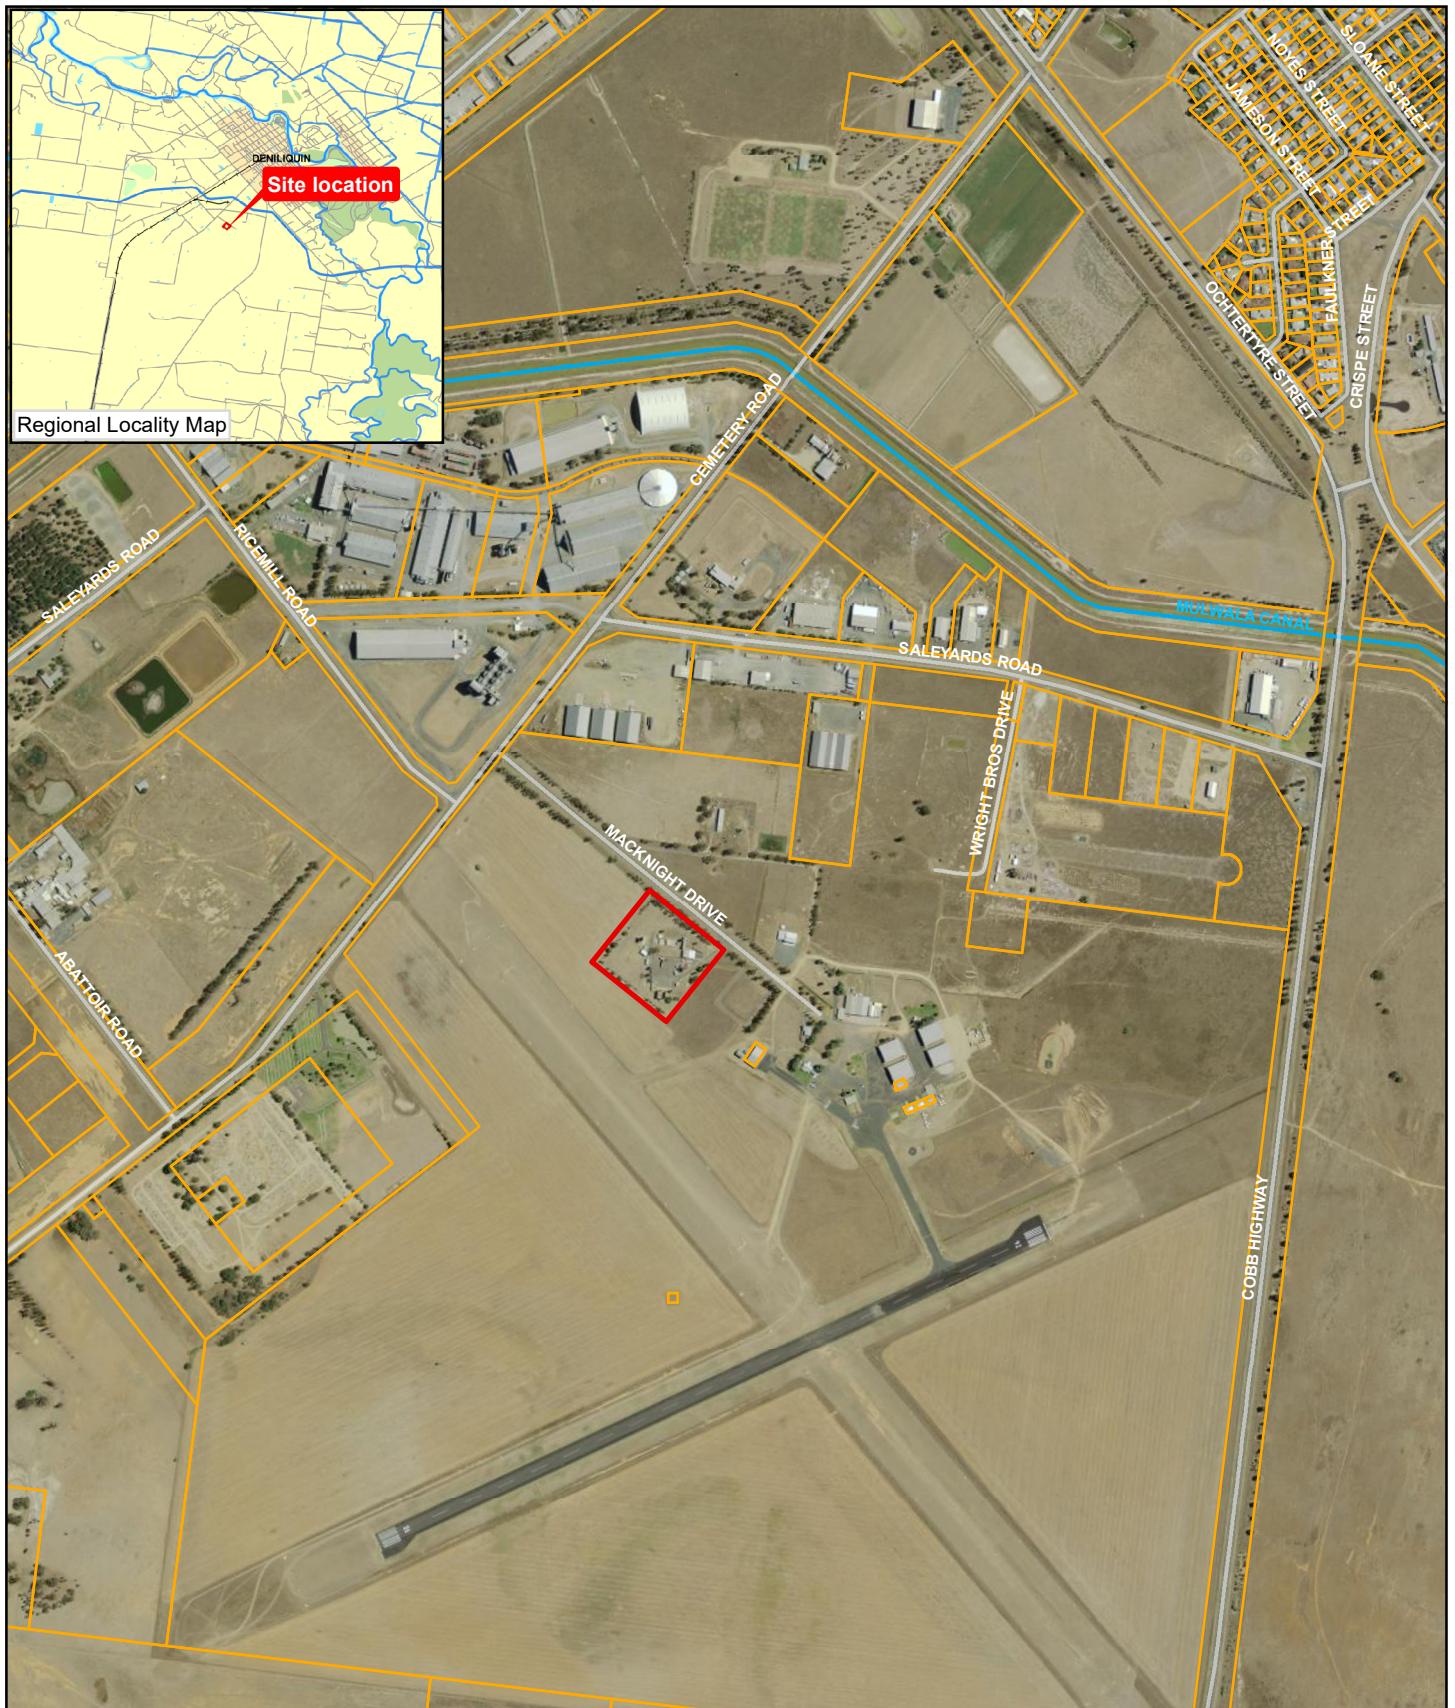

- Further groundwater and surface water monitoring at existing sampling locations to support trend analysis and further inform the CSM

- Undertake a desktop biodiversity study to identify potential ecological receptors (i.e. fauna) within the investigation area that may utilise the surface water drainage system, to refine the CSM for the site and investigation area
- Review of site management practices for training / discharge from fire trucks including consideration of drainage systems where the truck is garaged to assess whether run off is diverted to municipal water and the development and implementation of appropriate protocols for these activities
- Review of truck sampling data from fire truck 10492 against the wider program of works for FRNSW trucks currently in progress (GHD, 2019) and consideration of appropriate management actions based on the outcomes of that review.

\*RPDs have only been considered where a concentration is greater than 1 times the EQL.

\*\*Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 81 (1 - 10 x EQL); 50 (10 - 30 x EQL); 30 (> 30 x EQL))

\*\*\*Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

\*RPDs have only been considered where a concentration is greater than 1 times the EQL.

\*\*Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 81 (1 - 10 x EQL); 50 (10 - 30 x EQL); 30 (> 30 x EQL))

\*\*\*Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

## Sample Receipt Advice

Company name: **GHD Pty Ltd NSW**

Contact name: **Emmylou Cooke**

Project name: **ADDITIONAL MONITORING DENILINUIN AND WAGGA WAGGA**

Project ID: **2128370**

COC number: **Not provided**

Turn around time: **5 Day**

Date/Time received: **Jul 22, 2019 9:00 AM**

Eurofins reference: **666984**

### Sample information

- A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- Sample Temperature of a random sample selected from the batch as recorded by Eurofins Sample Receipt : 8.4 degrees Celsius.
- All samples have been received as described on the above COC.
- COC has been completed correctly.
- Attempt to chill was evident.
- Appropriately preserved sample containers have been used.
- All samples were received in good condition.
- Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- Appropriate sample containers have been used.
- Sample containers for volatile analysis received with zero headspace.
- Split sample sent to requested external lab.
- Some samples have been subcontracted.

**Notes** N/A Custody Seals intact (if used).

Sample 10492\_RNC8F0 received empty, analysis cancelled. Samples SSSD01, SSSD02 (1 tub each), SWSD01, SWSD02, GWSD01 and FTSD01 (1 bottle each) sent to ALS.

### Contact notes

If you have any questions with respect to these samples please contact:

Alena Bounkeua on Phone : or by e.mail: AlenaBounkeua@eurofins.com

Results will be delivered electronically via e.mail to Emmylou Cooke - Emmylou.Cooke@ghd.com.

**Sample History**

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.

A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

## Internal Quality Control Review and Glossary

### General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

### Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

**\*\*NOTE:** pH duplicates are reported as a range NOT as RPD

### Units

**mg/kg:** milligrams per kilogram

**mg/L:** milligrams per litre

**ug/L:** micrograms per litre

**ppm:** Parts per million

**ppb:** Parts per billion

**%:** Percentage

**org/100mL:** Organisms per 100 millilitres

**NTU:** Nephelometric Turbidity Units

**MPN/100mL:** Most Probable Number of organisms per 100 millilitres

### Terms

<b>Dry</b>	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
<b>LOR</b>	Limit of Reporting.
<b>SPIKE</b>	Addition of the analyte to the sample and reported as percentage recovery.
<b>RPD</b>	Relative Percent Difference between two Duplicate pieces of analysis.
<b>LCS</b>	Laboratory Control Sample - reported as percent recovery.
<b>CRM</b>	Certified Reference Material - reported as percent recovery.
<b>Method Blank</b>	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
<b>Surr - Surrogate</b>	The addition of a like compound to the analyte target and reported as percentage recovery.
<b>Duplicate</b>	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
<b>USEPA</b>	United States Environmental Protection Agency
<b>APHA</b>	American Public Health Association
<b>TCLP</b>	Toxicity Characteristic Leaching Procedure
<b>COC</b>	Chain of Custody
<b>SRA</b>	Sample Receipt Advice
<b>QSM</b>	US Department of Defense Quality Systems Manual Version 5.3
<b>CP</b>	Client Parent - QC was performed on samples pertaining to this report
<b>NCP</b>	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
<b>TEQ</b>	Toxic Equivalency Quotient

### QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpa, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

### QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

**Quality Control Results**

## Comments

### Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

### Qualifier Codes/Comments

Code	Description
C01	Leachate Fluid Key: 1 - pH 5.0; 2 - pH 2.9; 3 - pH 9.2; 4 - Reagent (DI) water; 5 - Client sample, 6 - other
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

**Sample History**

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.

A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time

## Internal Quality Control Review and Glossary

### General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

### Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

**\*\*NOTE:** pH duplicates are reported as a range NOT as RPD

### Units

**mg/kg:** milligrams per kilogram

**mg/L:** milligrams per litre

**ug/L:** micrograms per litre

**ppm:** Parts per million

**ppb:** Parts per billion

**%:** Percentage

**org/100mL:** Organisms per 100 millilitres

**NTU:** Nephelometric Turbidity Units

**MPN/100mL:** Most Probable Number of organisms per 100 millilitres

### Terms

<b>Dry</b>	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
<b>LOR</b>	Limit of Reporting.
<b>SPIKE</b>	Addition of the analyte to the sample and reported as percentage recovery.
<b>RPD</b>	Relative Percent Difference between two Duplicate pieces of analysis.
<b>LCS</b>	Laboratory Control Sample - reported as percent recovery.
<b>CRM</b>	Certified Reference Material - reported as percent recovery.
<b>Method Blank</b>	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
<b>Surr - Surrogate</b>	The addition of a like compound to the analyte target and reported as percentage recovery.
<b>Duplicate</b>	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
<b>USEPA</b>	United States Environmental Protection Agency
<b>APHA</b>	American Public Health Association
<b>TCLP</b>	Toxicity Characteristic Leaching Procedure
<b>COC</b>	Chain of Custody
<b>SRA</b>	Sample Receipt Advice
<b>QSM</b>	US Department of Defense Quality Systems Manual Version 5.3
<b>CP</b>	Client Parent - QC was performed on samples pertaining to this report
<b>NCP</b>	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
<b>TEQ</b>	Toxic Equivalency Quotient

### QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpa, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

### QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

## Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
<b>Method Blank</b>

## Comments

## Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

## **Qualifier Codes/Comments**

Code	Description
G01	The LORs have been raised due to matrix interference
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

**Sample History**

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.

A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Conductivity (at 25°C)	Melbourne	Jul 24, 2019	28 Days
- Method: LTM-INO-4030 Conductivity

## Internal Quality Control Review and Glossary

### General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

### Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

**\*\*NOTE:** pH duplicates are reported as a range NOT as RPD

### Units

**mg/kg:** milligrams per kilogram

**mg/L:** milligrams per litre

**ug/L:** micrograms per litre

**ppm:** Parts per million

**ppb:** Parts per billion

**%:** Percentage

**org/100mL:** Organisms per 100 millilitres

**NTU:** Nephelometric Turbidity Units

**MPN/100mL:** Most Probable Number of organisms per 100 millilitres

### Terms

<b>Dry</b>	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
<b>LOR</b>	Limit of Reporting.
<b>SPIKE</b>	Addition of the analyte to the sample and reported as percentage recovery.
<b>RPD</b>	Relative Percent Difference between two Duplicate pieces of analysis.
<b>LCS</b>	Laboratory Control Sample - reported as percent recovery.
<b>CRM</b>	Certified Reference Material - reported as percent recovery.
<b>Method Blank</b>	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
<b>Surr - Surrogate</b>	The addition of a like compound to the analyte target and reported as percentage recovery.
<b>Duplicate</b>	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
<b>USEPA</b>	United States Environmental Protection Agency
<b>APHA</b>	American Public Health Association
<b>TCLP</b>	Toxicity Characteristic Leaching Procedure
<b>COC</b>	Chain of Custody
<b>SRA</b>	Sample Receipt Advice
<b>QSM</b>	US Department of Defense Quality Systems Manual Version 5.3
<b>CP</b>	Client Parent - QC was performed on samples pertaining to this report
<b>NCP</b>	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
<b>TEQ</b>	Toxic Equivalency Quotient

### QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpa, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

### QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

## Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
<b>Method Blank</b>							
Total Dissolved Solids Dried at 180°C ± 2°C	mg/L	< 10			10	Pass

## Comments

## Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

## **Qualifier Codes/Comments**

Code	Description
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

Accredited for compliance with  
ISO/IEC 17025 - Testing

## General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

Ø = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

## General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot

CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

RPD = Relative Percentage Difference

# = Indicates failed QC

## Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

## Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

**Matrix Spike (MS) Report**

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

## QA/QC Compliance Assessment to assist with Quality Review

Work Order	: ES1923114	Page	: 1 of 5
Client	: GHD PTY LTD	Laboratory	: Environmental Division Sydney
Contact	: MS EMMYLOU COOKE	Telephone	: +61-2-8784 8555
Project	: 2128370	Date Samples Received	: 23-Jul-2019
Site	:	Issue Date	: 29-Jul-2019
Sampler	: ----	No. of samples received	: 6
Order number	: 2128370	No. of samples analysed	: 6

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

### **Summary of Outliers**

#### **Outliers : Quality Control Samples**

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- **NO** Matrix Spike outliers occur.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

#### **Outliers : Analysis Holding Time Compliance**

- **NO** Analysis Holding Time Outliers exist.

#### **Outliers : Frequency of Quality Control Samples**

- **NO** Quality Control Sample Frequency Outliers exist.

## Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: SOIL

Evaluation: ✘ = Holding time breach ; ✓ = Within holding time.

## Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

### Matrix: SOIL

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
<b>Laboratory Duplicates (DUP)</b>						
Moisture Content	EA055	1	10	10.00	10.00	✓ NEPM 2013 B3 & ALS QC Standard
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	2	20	10.00	10.00	✓ NEPM 2013 B3 & ALS QC Standard
<b>Laboratory Control Samples (LCS)</b>						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	20	5.00	5.00	✓ NEPM 2013 B3 & ALS QC Standard
<b>Method Blanks (MB)</b>						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	20	5.00	5.00	✓ NEPM 2013 B3 & ALS QC Standard
<b>Matrix Spikes (MS)</b>						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	20	5.00	5.00	✓ NEPM 2013 B3 & ALS QC Standard

### Matrix: WATER

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification

## Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

<i>Analytical Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-House. A portion of soil is extracted with MTBE. The extract is taken to dryness, made up in mobile phase. Analysis is by LC/MSMS, ESI Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. This method complies with the quality control definitions as stated in QSM 5.1. Data is reviewed in line with the DQOs as stated in QSM5.1
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In house: Direct injection analysis of fresh waters after dilution (1:1) with methanol. Analysis by LC-Electrospray-MS-MS, Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. This method complies with the quality control definitions as stated in QSM 5.1. Data is reviewed in line with the DQOs as stated in QSM5.1

<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Sample Extraction for PFAS	EP231-PR	SOIL	In house
Preparation for PFAS in water.	EP231-PR	WATER	Method presumes direct injection without workup. Preparation includes addition of internal standard and surrogate, and filtration prior to analysis.
